Towards an historical ecology of domestic dogs, wolves, and other canids on the Pacific Northwest Coast

Dr. Iain McKechnie
Assistant Professor and Hakai Institute Scholar,
Department of Anthropology, University of Victoria

Dogs are the earliest and most widespread domesticated animal in the Americas yet archaeologists know relatively little about their ancient distribution along the Pacific Northwest Coast. This presentation details emerging archaeological evidence indicating the extent to which these domesticated human companions have played roles in Indigenous cultures in comparison to other non-domestic canids such as wolves, foxes, and coyotes.
