Marine Conservation in Myanmar: A very geographical tale

Phil Dearden
Professor, Department of Geography
University of Victoria

After decades of political seclusion, Myanmar is witnessing a re-awakening to the rest of the world. One of the hurdles being faced is to establish conservation practices that will help address the rapid environmental degradation of the past few decades. This presentation weaves history, anthropology, marine biology, and political science into a geographical synthesis of some of the main challenges, and solutions required to enhance marine conservation with a heavy emphasis on indigenous and community engagement.
