At this point we are providing the Dynamic Edge graphic element in two sizes. One is the basic length of 8.5 inches (the width of a letter or the width of a tabloid sheet) and the other is 17 inches which is double that. This is for horizontal use on the width of a letter or the width of a tabloid sheet.

For longer applications the graphic can be added to the end – ad infinitum (some detailed adjustments to the connections might be necessary). We will need to work out how bleed is handled and other rules around how much flexibility there should be. There is also the transparent overlay effect which is a key part of using this graphic element. Use the multiply blending mode on the segments that should look like a transparent overlay.

*dimensions are measured in pixels, width x height*
